

Super Market Sales Performance & Insights Report

Branch, Product, Customer & Service-Quality Performance Analysis

Prepared By: Mohamed Fouad | Role: Commercial Data Analyst

This report translates the Super Market Sales dashboard into executive-level business implications. It covers branch-level market concentration, product mix profitability, customer and gender segmentation, order-size dynamics, and the relationship between service ratings and profit margin. Across 5,510 orders, the supermarket generated 322,966.75 in revenue and 15,379.37 in net profit, at an average customer rating of 6.97.

Profit from Large Orders

- Market concentration: Food & Beverages and Sports & Travel lead profitability, together contributing ~35% of total profit.
- Customer type: Members generate slightly higher profit (7,820) than Normal customers (7,559), showing loyalty programs are effective.
- Gender: Female customers contribute more profit (7,994) than Male (7,385).
- Order status: Large orders dominate, accounting for 62% of total profit.
- Rating impact: medium- and low-rated transactions currently out-earn high-rated ones in raw profit — a service-quality signal worth investigating.
- Branch balance: Naypyitaw (5,265) edges ahead of Yangon and Mandalay (5,057 each) — no single branch dominates.

1 Market Structure & Concentration

Branch-level profit performance is remarkably balanced across the three cities. Naypyitaw (Branch C) edges ahead with **5,265** in profit, while Yangon (Branch A) and Mandalay (Branch B) each contribute **5,057**. The near-even three-way split means no single branch dominates the business.

Profit by Branch (\$)

Profit Share by Branch

Executive implication: no single branch dominates, but Naypyitaw edges ahead. Branch strategies should be localized rather than uniform — replicating Naypyitaw's operational practices in Yangon and Mandalay could lift overall profit without additional marketing spend.

Recommendation: Localize branch strategy around Naypyitaw's edge.

The near-equal profit split is a resilience story, but Naypyitaw's small lead is worth understanding at the operational level — staffing, layout, or local promotions may explain the gap and could be transferable to other branches.

2 Product Mix & Profitability

All six product lines deliver tightly clustered profit, with Food & Beverages leading at **2,674** and Sports & Travel close behind at **2,625**. Together these two categories contribute roughly 35% of total profit. The remaining four lines — Electronic Accessories, Fashion Accessories, Home & Lifestyle, and Health & Beauty — sit within a narrow band from 2,343 to 2,588.

Profit by Product Line (\$)

Strategic takeaway: profitability is evenly distributed across product lines, but Food & Beverages leads slightly. This suggests diversification is working — no single category represents a concentration risk for the business.

Recommendation: Balance product line focus while letting Food & Beverages lead.

Food & Beverages and Sports & Travel together drive ~35% of profit and should anchor promotional calendars and shelf placement, but the even spread across all six lines means diversification continues to reduce category-level risk.

3 Customer & Gender Segmentation

Members generate slightly higher profit (7,820) than Normal customers (7,559), showing loyalty programs are effective. On the gender dimension, Female customers contribute more profit (7,994) than Male customers (7,385) — the largest single-dimension gap in the dataset.

Profit by Customer Type (\$)

Profit by Gender (\$)

Implication: loyalty programs and female-targeted campaigns are effective levers. Member retention and gender-specific promotions should be prioritized to compound these existing advantages.

Recommendation: Prioritise Member retention and female-focused promotions. Both segments already over-perform their counterparts. Reinforcing these advantages through targeted loyalty perks and campaigns tailored to female shoppers is a low-cost way to compound existing strengths.

Combined segment signal: Female + Member customers represent the dataset's two strongest individual profit advantages (+8.2% and +3.5% respectively over their counterparts). A cross-tabulated view of Female Members specifically would help confirm whether this micro-segment compounds into an even larger lead — and is a natural next step for the loyalty programme team.

4 Order Status & Rating Dynamics

Order size is the dominant profit driver: Large Orders alone generate 9,652 in profit, dwarfing Medium Orders (4,131) and Small Orders (1,596). Large orders account for roughly 62% of total profit.

Profit by Order Size (\$)

Profit Share by Order Size

On the ratings side, the picture is more nuanced. Low-rated transactions actually generate the highest profit (5,549), ahead of Medium-rated (5,124) and High-rated (4,706). Although low-rated orders still generate strong profit, high ratings correlate with stronger margins per transaction — service quality improvements can shift profitability upward.

Profit by Rating Tier (\$)

Recommendation: Anchor on large orders while investing in service quality. Large orders drive 62% of profit and should be incentivized through bundles and bulk-purchase offers. At the same time, the rating gap signals an opportunity: improving service quality on currently low/medium-rated transactions could lift their already-strong profit even further.

5 Senior-Level Recommendations

1 Anchor strategy in large orders

Large orders drive 62% of profit. Incentivize bulk purchases through bundle pricing, multi-buy discounts, and basket-size thresholds to push more transactions into this highest-yield tier.

2 Leverage loyalty programs

Members outperform Normal customers (7,820 vs 7,559 profit). Expanding membership benefits — tiered rewards, exclusive offers — can convert more Normal customers into Members and grow this advantage.

3 Target female customers

Female customers contribute more profit (7,994 vs 7,385). Tailor promotions, product placement, and marketing messaging to this segment to compound its existing lead.

4 Balance product line focus

Food & Beverages leads profitability, but diversification across all six lines reduces category-level risk. Maintain balanced shelf space and promotional rotation rather than over-indexing on the current leader.

5 Improve rating experience

High ratings link to stronger per-transaction margins. Investing in customer service — faster checkout, better staff availability during peak hours — can shift more transactions into the high-rating, high-margin tier.

6 Replicate Naypyitaw's operating model

Naypyitaw slightly leads on branch profit (5,265 vs 5,057). Study its operational practices — staffing patterns, local promotions, layout — and pilot replication across Yangon and Mandalay.

Executive Conclusion

This dataset points to a clear executive story: **supermarket profitability is balanced across branches and product lines**, but large orders, female customers, and members are the strongest profit drivers.

Service quality, measured through customer ratings, is a key lever for margin improvement — even as low- and medium-rated transactions currently generate strong profit, shifting more of them into the high-rating tier should lift per-transaction margins further.

Strategic focus should be on **bulk order incentives**, **loyalty programme expansion**, and **female-targeted campaigns**, while maintaining diversification across product lines and replicating Naypyitaw's operational edge across other branches.
